IN THE ABSTRACT:

Please amend the abstract as indicated:

The invention provides method of removing dental plaque in an animal subject comprising: contacting the dental plaque with a dental plaque removing effective amount of a hydrolase mixture comprising enzymes from krill.

relates to a multifunctional enzyme that can be derived from crustaseans or fish. The enzyme has at least one of a chymotrypsin, trypsin, elastase, collagenase and exe peptidase activity, and a molecular weight between about 20 kd and about 40 kd as determined by SDS PAGE. Preferably, the multifunctional enzyme has substantial anti-cell cell adhesion activity. Preferably, the multifunctional enzyme has substantial homology with the krill multifunctional enzyme. These enzymes are useful for treating viral infections such as herpes outbreaks, fungal, bacterial or parasitic infections, including the primary and secondary infections of leprosy, colitis, ulcors, homorrheide, corneal searring, dental plaque, acne, cystic fibrosis, blood clots, wounds, immune disorders including autoimmune disease and cancer. Additionally, the invention relates to a method of purifying the multifunctional enzyme, and to a preparation of essentially purified multifunctional enzyme.
